

## Infrared Thermography Testing

Loose connections and overloaded equipment increase operating costs, present safety risks, create power quality problems and can seriously damage equipment, resulting in down-time. These problems can often be identified with infrared scanning before they create serious problems. OMLPS owns and operates their own infrared camera and will perform inspection services for your distribution facilities and equipment.

## Our Services

### Electrical Monitoring

- Production
- Transmission
- Distribution
- Switchgear
- Electric Panel

### Mechanical Monitoring

- Motors
- Pumps
- Various Rotating Equipment

### Buildings and Structures Monitoring

- Insulation
- Air Infiltration

## Benefits of Service

Eliminate loose or corroded electrical connections.

Reduce electric losses.

Identify potential electrical and equipment failures in advance.

Identify areas of heat loss due to poor construction, missing or inadequate insulation and moisture intrusion.

Increase building energy efficiency and structural integrity.

Improved safety and reliability by early identification of design, workmanship or equipment failure.
